PRODUCTS

Continually Elevating Return

## **Regulatory Regulations**

## Regulatory Regulations

Does your product require regulatory management? Regulatory management has several levels i.e. initial assessment, BOM control, final product testing and auditing (internal and external). Vergent Products has established relationships with UL, ULC, CE, CSA, TUV and ETL that enables us to control and manage your regulatory requirements.

**Initial Assessment:** Vergent will work with you to determine your products desired markets. Each market may require different or multiple regulatory certifications and various levels of testing and auditing.

**BOM Control:** Vergent Products will validate your BOM based on initial regulatory requirements or based on established Follow-UP Service requirements (FUS). We have the controls in place to flag all material requiring regulatory verification. These controls accompany the material from procurement through storage, final assembly and post shipment traceability.

**Final Product Testing:** Depending on your products final destination and usage, various tests may be required by your regulatory file. Vergent has the personnel and capabilities to complete very complex final product testing. Vergent can manage test requirements from ICT, functional, continuity and hi-pot. All test records are maintained in our proprietary data management system. Vergent has made it a standard practice to hi-pot test all final assemblies requiring AC power, regardless of regulatory requirements.

**Auditing:** Each quarter Vergent undergoes unannounced audits from each regulatory agency in which we are managing a file. It is very important to maintain records for these audits. The more efficient the audit is the more money that you save because less time is required by the auditor. Vergent also has a stringent internal audit process for all regulatory files. The internal audit process allows us to proactively manage your safety portfolio.

Whether you need a regulatory project managed from the design phase or you need an existing product file managed, Vergent Products has controlled process that enables you to get the highest return on your investment. Vergent Products thinks and works differently to assure that your products are designed, manufactured and serviced with safety at the forefront of our processes.
